## Quiz 2.4 - Exact Differentials

## Natural Variables

Write the exact differentials for the four main thermodynamic potentials (U, H, G,and A) with respect to their natural variables in two forms: (The Wikipedia page on "Thermodynamic Potentials" can be very helpful here, but Helmholtz energy is F instead of A on that page)

$$dU = \left(\frac{\partial U}{\partial S}\right)_{V} dS + \left(\frac{\partial U}{\partial V}\right)_{S} dV$$

$$dV = \left(\frac{\partial U}{\partial S}\right)_{V} dS + \left(\frac{\partial U}{\partial V}\right)_{S} dV$$

$$dV = \left(\frac{\partial U}{\partial S}\right)_{V} dS + \left(\frac{\partial U}{\partial V}\right)_{S} dV$$

$$dV = \left(\frac{\partial U}{\partial S}\right)_{V} dS + \left(\frac{\partial U}{\partial V}\right)_{S} dV$$

$$dV = \left(\frac{\partial U}{\partial S}\right)_{V} dS + \left(\frac{\partial U}{\partial V}\right)_{S} dV$$

$$dV = \left(\frac{\partial U}{\partial S}\right)_{V} dS + \left(\frac{\partial U}{\partial V}\right)_{S} dV$$

$$dV = \left(\frac{\partial U}{\partial S}\right)_{V} dS + \left(\frac{\partial U}{\partial V}\right)_{S} dV$$

$$dV = \left(\frac{\partial U}{\partial S}\right)_{V} dS + \left(\frac{\partial U}{\partial V}\right)_{S} dV$$

$$dV = \left(\frac{\partial U}{\partial S}\right)_{V} dS + \left(\frac{\partial U}{\partial V}\right)_{S} dV$$

$$dG = \left(\frac{\partial G}{\partial T}\right) dT + \left(\frac{\partial G}{\partial P}\right)_T dT \qquad dA = \left(\frac{\partial A}{\partial T}\right)_V dT + \left(\frac{\partial A}{\partial V}\right)_T$$

$$dA = \left(\frac{\partial A}{\partial \tau}\right)_{V} d\tau + \left(\frac{\partial A}{\partial V}\right)_{T} dV$$

Replacing the partial derivatives with the appropriate state variables

## Properties of Ideal gases

$$dG = -SdT + Vdp$$
  $dA = -SdT - pdV$ 

Find the following properties in terms of state variables (i.e. solve the derivatives) for an ideal gas:

$$\circ \ \pi_T = \left(\frac{\partial \mathcal{U}}{\partial \mathcal{V}}\right)_T$$

$$\circ \pi_T = \left(\frac{\partial U}{\partial V}\right)_T \quad \text{for an ideal gas, } U = C_V T \quad \text{and} \quad C_V \text{ is independent of } V$$

$$50 \left(\frac{\partial u}{\partial V}\right)_T = 0$$

$$\circ \alpha = \frac{1}{V} \left( \frac{\partial V}{\partial T} \right)_{p} = \frac{1}{V} \left( \frac{\partial V}{\partial T} \right)_{p} = \frac{1}{V} \left( \frac{\partial V}{\partial T} \right)_{p} = \frac{nR}{PV} \left( \frac{1}{P} \right)_{q} = \frac{nR}{PV}$$

$${}^{\circ} \kappa_{T} = -\frac{1}{V} \left( \frac{\partial V}{\partial \rho} \right)_{T} = -\frac{1}{V} \left( \frac{\partial$$

## **Joule-Thompson Coefficients**

The Joule-Thompson coefficient is positive for most gases under most conditions. State the following:

• What conditions will lead to a negative coefficient for most gases?

Extremely high or low T, and extremely high p

o Give an example of a gas with a negative coefficient at STP
